

GLOBAL MORTALITY ANALYSIS

Insight Report

Overview

This report presents the key findings from the Tableau analysis in simple, professional language. It answers the five business questions using the completed dashboards and worksheets.

Business Questions & Answers

1. What are the top causes of death globally?

Cardiovascular diseases are the leading cause highlighted in the analysis, with **neoplasms (cancer)** also among the major causes of death. This shows that chronic diseases represent a major share of global mortality.

2. Which countries face higher infectious disease burden?

India stands out in the Regional Health Risk Map as a country with a high infectious-disease burden. The map also shows that infectious-disease mortality varies considerably across countries and regions.

3. Are lifestyle diseases increasing over time?

Overall, lifestyle-related mortality remains high and becomes more prominent over the period analysed. Cardiovascular diseases and neoplasms remain major causes throughout the trend, while diabetes also becomes more prominent. The trend is not a steady increase in every individual year.

4. Which countries experience the highest conflict-related mortality?

Rwanda has the highest conflict-related mortality in the Global Violence Map. The Conflict Deaths Trend also shows a major spike in 1994, highlighting how sharply conflict-related mortality can vary across different periods.

5. Which regions face multiple health risks simultaneously?

The Violence vs Disease Burden analysis highlights **India, China, Russia and Brazil** as countries with comparatively high disease mortality and comparatively high violence mortality. These countries illustrate the dual-burden pattern identified in the analysis.

Key Quantitative Findings

Category	Deaths
Lifestyle Diseases	3,702,859,882
Infectious Diseases	939,885,880
External Causes	357,940,995

Conclusion

The analysis shows that chronic diseases are a major global mortality concern, while infectious-disease burden is particularly high in countries such as India. Conflict-related mortality is concentrated in specific countries and periods, with Rwanda showing the highest value on the Global Violence Map. The analysis also identifies countries where disease and violence create a combined mortality burden.
